## Linear Representations of Finite Groups by Serre Exercises completed by Caitlin Beecham

## Exercise 2.7

Show that each character of G which is zero for all  $s \neq 1$  is an integral multiple of the character  $r_G$  of the regular representation.

Note that since  $(\chi|1)$  is the number of times the associated representation contains the unit representation, it is an integer. Recall that

$$(\chi|1) = \frac{1}{g} \sum_{s \in G} \chi(s)$$

but  $\chi(s) = 0$  for  $s \neq 1$  and thus

$$(\chi|1) = \frac{1}{q}\chi(1)$$

which implies that g divides  $\chi(1)$ , thus proving that  $\chi = mr_G$  for some  $m \in \mathbb{Z}$ .

## Exercise 2.8

Let H be the vector space of linear mappings  $h: W_i \to V$  such that  $\rho_s h = h\rho_s$  for all  $s \in G$ . Each  $h \in H_i$  maps  $W_i$  into  $V_i$ .

- (a) Show that the dimension of  $H_i$  is equal to the number of times that  $W_i$  appears in V, i.e. to  $\dim(V_i)/\dim(W_i)$ . (Reduce to the case where  $V=W_i$  and use Schur's Lemma).
  - Fix any non-zero  $h \in H_i$ . Denote it  $h_1$  and let  $U_i^1 := im(h_1) \subseteq V_i$ .
  - Show that  $U_i^1 \cong W_i$ 
    - To do so, we note that  $U_i^1$  is a subspace of  $V_i$ , which I also claim is stable under the action of  $\rho_g$  for all g which along with the fact that  $U_i^1$  is irreducible (Is it?) would imply that  $U_i^1 \cong W_i$ .
    - Indeed,  $U_i^1$  is stable under the action of  $\rho_g$  since for all  $u \in U_i^1$  one has by definition that  $u = h_1(w)$  for some  $w \in W_i$  and then

$$\rho_q(u) = \rho_q(h_1(w)) = h_1(\rho_q(w)) = h(w')$$

for some  $w' \in W_i$  since  $W_i$  is stable under the action of G. and thus  $\rho_g(u) \in U_i^1 = \operatorname{im}(h_1)$ .

- Also,  $U_i^1$  is irreducible for the same reason. Otherwise, if there were some subspace  $U_i^{1\prime} \subseteq U_i^1$  which was stable under the action of G, then note that if  $W_1' := h^{-1}(U_i^{1\prime}) := \{w \in W_i : h_1(w) \in U_i^{1\prime}\}$  denotes the set of pre-images under  $h_1$ , then  $W_1' \subseteq W_i$  and since  $W_i$  is irreducible one knows that  $W_1'$  is not stable under G. More precisely, there exists  $g \in G, w' \in W_1'$  such that  $u' := \rho_q(w_1') \notin W_1'$ . Thus,

$$\rho_g(h_1(w_1')) = h_1(\rho_g(w_1')) = h_1(u') \notin U_i^{1'}.$$

since  $W_1'$  was by definition all pre-images  $\{w \in W_i : h_1(w) \in U_i^{1'}\}$ .

- Also, up to isomorphism  $W_i$  is the only irreducible subspace of  $V_i$ .
- Then, use Schur's Lemma.
  - Namely,  $W_i \cong U_i^1$  implies that there exists an isomorphism  $\phi_i^1: U_i^1 \to W_i$ . So, define  $\hat{h}: U_i^1 \to U_i^1$  by  $\hat{h}(w) = h(\phi_i^1(w))$ .
  - Now, part (2) of Schur's lemma says that since  $\rho_g \hat{h} = \hat{h} \rho_g$  for all  $g \in G$ ,  $\hat{h}$  is a homothety.

• Now, we first show that  $\dim(H_i) \geq n_i$  by an inductive argument. Namely, for  $k < n_i$  suppose we have

$$\{h_1,\ldots,h_k\}\subseteq H_i$$
 a linearly independent set

such that

$$U_i^j := \operatorname{im}(h_i) \cong W_i$$

and

$$Y_k := \operatorname{span}(\{U_i^j : j \in [k]\}) \cong \bigoplus_{j \in [k]} W_i.$$

Then, we show that there exists

$$h_{k+1} \in H_i$$

such that

- $-U_i^{k+1} := \operatorname{im}(h_{k+1}) \cong W_i,$
- $-Y_k \cap U_i^{k+1} = \{0\},\$
- and  $\{h_1, \ldots, h_k, h_{k+1}\} \subseteq H_i$  is a linearly independent set.
- The first two points of course imply that

$$Y_{k+1} := \text{span}(\{U_i^j : j \in [k+1]\}) \cong \bigoplus_{j \in [k+1]} U_i^j \cong \bigoplus_{j \in [k+1]} W_i.$$

- All together, this will show that we can find a set of  $n_i$  linearly independent functions  $\{h_1, \ldots, h_{n_i}\} \subseteq H_i$  which shows  $\dim(H_i) \ge n_i$ .
- After we carry out the above argument we will also show that  $\dim(H_i) \leq n_i$ .
- Now, we perform the above inductive proof by constructing the desired  $h_{k+1} \in H_i$  from above as follows.
  - First, recall by Theorem 1 that there exists a complement  $Y'_{k+1}$  of  $Y_k$  in  $V_i$  which is stable under the action of G.
  - So, since  $Y_k = \bigoplus_{i \in [k]} U_i^j \cong \bigoplus_{i \in [k]} W_i$  we have that

$$Y_{k+1}' \cong \bigoplus_{j \in [k+1:n_i]} W_i$$

since otherwise.

$$V_i \cong \bigoplus_{j \in [n_i]} W_i$$

and

$$V_i \cong Y_k \oplus Y'_{k+1} \cong (\bigoplus_{j \in [k]} W_i) \oplus Y'_{k+1} \not\cong (\bigoplus_{j \in [k]} W_i) \oplus (\bigoplus_{j \in [k+1:n_i]} W_i) \cong \bigoplus_{j \in [n_i]} W_i$$

provide a contradiction. TODO: Prove definitively that if  $W \ncong V$  then  $U \oplus W \ncong U \oplus V$ .

- So, since  $Y'_{k+1} \cong \bigoplus_{j \in [k+1:n_i]} W_i$  that implies that there exist subspaces  $U_i^{k+1}, \dots, U_i^{n_i} \subseteq Y'_{k+1}$  such that  $U_i^j \cong W_i$  are isomorphic as representations for all  $j \in [k+1:n_i]$ ,  $U_i^j \cap U_i^l = \{0\}$  for  $j \neq l \in [k+1:n_i]$  and so that  $Y'_{k+1} = \operatorname{span}\{U_i^j: j \in [k+1:n_i]\}$ .
- So, we choose  $w' \in U_i^{k+1}$  and recall that since  $U_i^k \cong W_i$  we have an isomorphism of representations

$$\phi_i^k: U_i^k \to W_i$$

and likewise we have an isomorphism of representations

$$\phi_i^{k+1}: U_i^{k+1} \to W_i$$

which means that for all  $j \in [k+1:n_i]$  we have an isomorphism of representations

$$\phi_i^{k+1}\circ (\phi_i^k)^{-1}:U_i^k\to U_i^{k+1}$$

- Then, if one defines

$$h_{k+1}: W_i \to U_i^{k+1}$$

by

$$h_{k+1}(w) = \phi_i^{k+1}((\phi_i^k)^{-1}(h_k(w)))$$
 for all  $w \in W_i$ ,

then one has that

$$\operatorname{im}(h_{k+1}) = U_i^{k+1} \text{ since } \operatorname{im}(h_k) = U_i^k,$$

Also, we define

$$\widehat{h}_{k+1}: U_i^{k+1} \to U_i^{k+1}$$

by

$$\hat{h}_{k+1}(w) = h_{k+1}(\phi_i^{k+1}(w))$$

then I claim that

$$\rho_g h_{k+1} = h_{k+1} \rho_g$$

since

$$\rho_a h_{k+1} = \rho_a \tau h_k$$

and

$$h_{k+1}\rho_q = \tau h_k \rho_q = \tau \rho_q h_k = \rho_q \tau h_k$$

since  $\tau$  is an isomorphism of representations.

- Then, by Schur's Lemma,

$$\hat{h}_{k+1}: U_i^{k+1} \to U_i^{k+1}$$

is a scalar operator.

- Now, we show that

 $\{h_1,\ldots,h_{k+1}\}\subseteq H_i$  is a linearly independent set

and that

$$Y_k \cap U_i^{j'} = \{0\}$$

as follows.

- First, assume for contradiction that  $\{h_1, \ldots, h_{k+1}\}$  is dependent. Then there exist  $c_1, \ldots, c_{k+1} \in F$ , not all zero, such that

$$\sum_{j \in [k+1]} c_j h_j = 0$$

is the zero function, then for arbitrary  $w \in W_i$  and in particular arbitrary  $w \neq 0$  we have that

$$\sum_{j \in [k+1]} c_j h_j(w) = 0$$

meaning that if  $c_{j'} \neq 0$  for  $j' \in [k+1]$  then

$$h_{j'}(w) = \sum_{j \in [k+1]: j \neq j'} \frac{-c_j}{c_{j'}} h_j(w).$$

However,  $h_{j'}(w) \in U_i^{j'}$  and  $h_j(w) \in U_i^j$  for all  $j \in [k+1] \setminus \{j'\}$ .

– Furthermore,  $U_i^j \cap U_i^{j'} = \{0\}$  for all  $j \neq j'$  and  $dim(Y_k \oplus U_i^{k+1}) = \sum_{j \in [k+1]} dim(U_i^j)$  which implies that

$$\left(\operatorname{span}(\{U_i^j:j\in[k+1],j\neq j'\})\right)\cap U_i^{j'}=\{0\}$$

since

$$Y_k \oplus U_i^{k+1} \cong (\bigoplus_{j \in [k]} U_i^j) \oplus U_i^{k+1} \cong (\bigoplus_{j \in [k+1]: j \neq j'} U_i^j) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus U_i^{j'} \cong \operatorname{span}(\{U_i^j: j \in [k+1], j \neq j'\}) \oplus$$

which by definition of direct sum gives the above.

- Now, we have a contradiction since

$$h_{j'}(w) \in \left( \text{span}(\{U_i^j : j \in [k+1], j \neq j'\}) \right) \cap U_i^{j'}$$

implies that  $h_{i'}(w) = 0$  but that implies that w = 0 since  $h_{i'}$  is a bijection, a contradiction.

- So, we have shown that  $\dim(H_i) \geq [n_i]$ .
- Now, to show that  $\dim(H_i) \leq [n_i]$ , we show that one cannot have a set of  $n_i+1$  linearly independent functions  $\{h_1,\ldots,h_{n_i+1}\}$ . The idea is to show that

$$\operatorname{im}(h_{n_i+1}) \cap \left(\operatorname{span}(\{U_i^j : j \in [n_i]\})\right) = \{0\}$$

where we denote  $U_i^j := \operatorname{im}(h_j)$ , which will provide a contradiction if we can also show that

$$im(h_i) \cong W_i$$

for all  $j \in [n_i + 1]$ .

- Once again, by the same logic as our earlier argument that  $U_i^1 \cong W_i$ , we have that  $U_i^j \cong W_i$  for all  $j \in [n_i + 1]$  (since the earlier logic actually shows that  $\operatorname{im}(h) \cong W_i$  for all  $h \in H_i$ ).
- Now, if we assume for contradiction that  $U_i^{n_i+1} \cap \left( \text{span}(\{U_i^j : j \in [n_i]\}) \right) \supseteq \{0\}$ , note that the intersection of subspaces  $U_i^{n_i+1} \cap \left( \text{span}(\{U_i^j : j \in [n_i]\}) \text{ is a subspace and then the preimage of a subspace is a subspace. Thus,}$

$$h_{n_i+1}^{-1}(U_i^{n_i+1}\cap \left(\operatorname{span}(\{U_i^j:j\in[n_i]\})\right)$$
 is a subspace of  $W_i$ .

I claim that  $h_j^{-1}(U_i^j\cap U_i^k)$  is a proper (since  $U_i^{n_i+1}\not\subseteq \left(\operatorname{span}(\{U_i^j:j\in[n_i]\})\right)$  TODO: double check!), non-zero subspace that is stable under the action of G, a contradiction since  $W_i$  is irreducible, thus proving that  $U_i^{n_i+1}\cap \left(\operatorname{span}(\{U_i^j:j\in[n_i]\})\right)=\{0\}$ , thus providing a contradiction since  $V_i=\operatorname{span}(\{U_i^j:j\in[n_i]\})$  and  $U_i^{n_i+1}\subseteq V_i$  implies that  $U_i^{n_i+1}=\{0\}$  which would imply that  $h_{n_i+1}=0$  is the zero function, a contradiction.

(b) Let G act on  $H_i \otimes W_i$  through the tensor product of the trivial representation of G on  $H_i$  and the given representation on  $W_i$ . show that the map

$$F: H_i \otimes W_i \to V_i$$

defined by the formula

$$F(\sum h_{\alpha} \cdot w_{\alpha}) = \sum h_{\alpha}(w_{\alpha})$$

is an isomorphism of  $H_i \otimes W_i$  onto  $V_i$ . [Same method].

We must show that

$$\rho_a F = F \rho_a$$

for all  $g \in G$ . So, first note that

$$\rho_g(\sum c_{\alpha}h_{\alpha}\otimes w_{\alpha})=\sum c_{\alpha}h_{\alpha}\otimes (\rho_g(w_{\alpha})),$$

and thus

$$F(\rho_g(\sum c_\alpha h_\alpha \otimes w_\alpha)) = F(\sum c_\alpha h_\alpha \otimes (\rho_g(w_\alpha)))$$

but by definition of F we have

$$F(\sum c_{\alpha}h_{\alpha}\otimes(\rho_g(w_{\alpha})))=\sum c_{\alpha}h_{\alpha}(\rho_g(w_{\alpha}))$$

but since  $h_{\alpha} \in H_i$  we have that

$$h_{\alpha}\rho_{q} = \rho_{q}h_{\alpha}$$

and thus

$$\sum c_{\alpha}h_{\alpha}(\rho_g(w_{\alpha})) = \sum c_{\alpha}\rho_g(h_{\alpha}(w_{\alpha})) = \rho_g(\sum c_{\alpha}h_{\alpha}(w_{\alpha})) = \rho_g(F(\sum c_{\alpha}h_{\alpha}\otimes w_{\alpha}))),$$

proving the claim. We now must show that F is a bijection. In particular, my work in part (a) shows that  $V_i \cong \bigoplus_{j \in [n_i]} \operatorname{im}(h_j)$  where  $\{h_j\}$  is any basis for  $H_i$  and also that  $\operatorname{im}(h_j) \cong W_i$ . So, we note that if  $\{w^1, \ldots, w^m\}$  is a basis for  $W_i$ , then

$$\{h_j \otimes w^k : j \in [n_i], k \in [m]\}$$

is a basis for  $H_i \otimes W_i$ . Now, to show that F is onto, we note that for any  $v \in V_i$  we have since  $V_i \cong \bigoplus_{j \in [n_i]} \operatorname{im}(h_j)$  that

$$\bigsqcup_{j \in [n_i]} \{ u_{i,k}^j : k \in [m] \}$$

is a basis for  $V_i$  where  $\{u_{i,k}^j: k \in [m]\}$  is a basis for  $\operatorname{im}(h_j)$  for each  $j \in [n_i]$ . Thus, for all  $v \in V_i$ , there exist  $c_k^j$  for  $j \in [n_i], k \in [m]$  such that

$$v = \sum_{j \in [n_i]} \sum_{k \in [m]} c_k^j u_{i,k}^j.$$

Then,  $u_{i,k}^j \in \operatorname{im}(h_j)$  for all  $j \in [n_i]$  and  $k \in [m]$  implies that there exist  $w_k^j \in W_i$  (not necessarily distinct) such that  $h_j(w_k^j) = u_{i,k}^j$ , and thus

$$v = \sum_{j \in [n_i]} \sum_{k \in [m]} c_k^j h_j(w_k^j) = F(\sum_{(j,k) \in [n_i] \times [m]} c_k^j h_j \otimes w_k^j).$$

Finally, F is injective, since otherwise if  $F(\sum_{(j,k)\in[n_i]\times[m]}c_k^jh_j\otimes w_k)=0$  for  $\sum_{(j,k)\in[n_i]\times[m]}c_k^jh_j\otimes w_k\neq 0$ , then that means precisely that

$$\sum_{(j,k)\in[n_i]\times[m]}c_k^jh_j(w_k)=0$$

but

$$\sum_{(j,k)\in[n_i]\times[m]} c_k^j h_j(w_k) = \sum_{j\in[n_i]} (\sum_{k\in[m]} h_j(c_k^j w_k)).$$

Now,  $c_{k'}^{j'} \neq 0$  for at least one (j',k') which implies that

$$h_{j'}(w_{k'}) = \sum_{(j,k)\in[n_i]\times[m]\setminus(j',k')} \frac{-c_k^j}{c_{k'}^{j'}} h_j(w_k).$$

However,  $h_j(c_k^j w_k) \in U_i^j$  for all  $j \in [n_i]$  and as shown in (a),  $U_i^{j'} \cap \text{span}(\{U_i^j : j \in [n_i] \setminus \{j'\}\}) = \{0\}$  which implies that  $h_{j'}(w_{k'}) = 0$  and thus  $w_{k'} = 0$  since  $h'_j$  is not the zero function, proving injectivity.

(c) Let  $(h_1, \ldots, h_k)$  be a basis of  $H_i$  and form the direct sum  $W_i \oplus \cdots \oplus W_i$  of k copies of  $W_i$ . The system  $(h_1, \ldots, h_k)$  defines in an obvious way a linear mapping h of  $W_i \oplus \cdots \oplus W_i$  into  $V_i$ ; show that it is an isomorphism of representations and that each isomorphism is thus obtainable [apply (b), or argue directly]. In particular, to decompose  $V_i$  into a direct sum of representations isomorphic to  $W_i$  amounts to choosing a basis for  $H_i$ .

The obvious mapping is defined as follows. As I showed in part (a), for this basis  $(h_1, \ldots, h_{n_i})$  we have that

$$V_i \cong \bigoplus_{j \in [n_i]} U_i^j$$

and

$$U_i^j \cong W_i$$

where  $U_i^j$  denotes  $U_i^j = \operatorname{im}(h_j)$ . Thus, for  $h \in H_i$  there of course exist  $c_1, \ldots, c_{n_i} \in F$  so that  $h = \sum_{j \in [n_i]} c_j h_j$  and then we define

$$h: \bigoplus_{j \in [n_i]} W_i \to V_i$$

by

$$h(\bigoplus_{j\in[n_i]} w_j) = \sum_{j\in[n_i]} c_j h_j(w_j).$$

I claim that  $h: \bigoplus_{j \in [n_i]} W_i \to V_i$  as defined above is an isomorphism of representations for all  $h \in H_i$ . Namely, I must show that

$$h\rho_q = \rho_q h$$

for all  $g \in G$  where we define action of G on  $V_i$  as usual and action of G on  $\bigoplus_{j \in [n_i]} W_i$  by

$$\rho_g(\bigoplus_{j\in[n_i]} w_j) = \bigoplus_{j\in[n_i]} \rho_g(w_j).$$

So,

$$h\rho_g(\bigoplus_{j\in[n_i]}w_j)=h(\bigoplus_{j\in[n_i]}\rho_g(w_j))=\sum_{j\in[n_i]}c_jh_j(\rho_g(w_j))=\sum_{j\in[n_i]}c_j\rho_g(h_j(w_j)) \text{ (since } h\in H_i)$$

but then

$$\sum_{j\in[n_i]}c_j\rho_g(h_j(w_j))=\rho_g(\sum_{j\in[n_i]}c_jh_j(w_j))=\rho_g(h(\bigoplus_{j\in[n_i]}w_j)).$$
